

Mechanical Parts Documentation

Conical plastic component designed for guiding flow or material direction.

Machined metal shaft with gear-like surface for torque transmission.

Vertical support structure providing stability to the assembly.

Top connection interface with internal threading for secure fitting.

Metal bowl-shaped component used for housing or distribution.

Perforated plate allowing controlled passage of material or fluid.

Side view of structural base showing thickness and geometry.

Threaded housing component used for connection between elements.

Mounting flange with circular opening for shaft alignment.

Detailed view of surface texture and casting quality.

Internal cavity showing structural depth and geometry.

External cylindrical section designed for coupling.

Base structure supporting vertical load distribution.

Connection port with internal threading for assembly.

Surface finish highlighting manufacturing method.

Curved support geometry improving load distribution.

Internal profile showing machining accuracy.

Outer surface showing coating and protection.

Component interface designed for modular assembly.

Symmetrical structure ensuring balance and alignment.

Circular geometry optimized for rotational components.

Material thickness ensuring mechanical durability.

Precision holes enabling uniform distribution.

Reinforced edges improving structural strength.

Central alignment hole for shaft positioning.

Compact design suitable for integrated systems.

Overall geometry supporting mechanical stability.
